

Agent Git Lab Teams - business plan

Executive summary

Agent Git Lab Teams helps bootcamp operators launch Git and GitHub learning paths in days, not months. The product combines a team onboarding portal with the Agent Git Lab learner app RAVEN built during the Hult Cohort Developer Program. Starter pricing targets small cohorts; Pro adds analytics export and priority support.

Problem and solution

Bootcamp leaders stitch Discord, Notion, and ad hoc workshops together. Learners stall before their first meaningful pull request. Agent Git Lab Teams gives operators a workspace, learner launch links, and qualified-action metrics without rebuilding PM, comms, or learning tooling.

Market and competition

Target customers are coding bootcamps, university cohort programs, and internal academies training agent-first developers. Competitors include GitHub Education bundles, Codecademy for Teams, and custom LMS stacks. Our wedge is cohort-native workflows plus agent-assisted lesson paths already proven in production.

Business model and pricing

- Starter: \$49/month per cohort (up to 30 seats)
- Pro: \$149/month per cohort (up to 120 seats, analytics export, priority support)
- Annual prepay: 2 months free

Go-to-market

Founder-led outreach to bootcamp directors, demo days, and alumni communities. Initial pilots through RAVEN's Hult cohort network and GitHub Education contacts. Target three pilot operators in Q4 2026.

Unit economics (assumptions labeled)

- Assumed CAC (founder-led): \$120 per paying cohort
- Assumed gross margin: 82% (hosting + support)
- Assumed LTV (12-month retention): \$980 Starter / \$1,790 Pro

- Payback target: under 2 months on Starter

Product roadmap (12 months)

1. Q4 2026: Team portal MVP, learner launch links, metrics export
2. Q1 2027: Seat management, SSO for operators, Slack digest
3. Q2 2027: Lesson authoring lite, cohort PM snapshot integration

Team and hiring plan

RAVEN (@raven-dubgub), founder and full-stack builder. First hire: customer success lead after 10 paying cohorts.

Financial projections (3 years, summary)

Year 1: 24 paying cohorts, ~\$42k ARR Year 2: 90 paying cohorts, ~\$165k ARR Year 3: 220 paying cohorts, ~\$410k ARR

Risks and mitigations

- Long bootcamp sales cycles: mitigate with founder-led pilots and cohort network intros
- Dependence on learner app uptime: shared infrastructure already in production with health checks
- Cohort submission gates: separate venture metrics namespace tracks qualified users independently
